## 1 INTRODUCTION

According to the DOW "description of work" Task 2.2 of the PEBS grant agreement, Solexperts is responsible for the monitoring and maintenance of the experiment HE-E as part of the PEBS project.

The HE-E Experiment is performed in the 50 m long microtunnel which has a diameter of 1.3 m. The 10 m test section of the microtunnel was characterised in detail during the Ventilation (VE) Experiment (Figure 1). Table 1 shows the task overview for the project identification and responsibility partners.

A series of annual monitoring reports is planned to document the data set recorded by the HE-E data acquisition system (DAS). In addition, the monitoring reports summarise the site activities, indicate DAS incidents and describe the measurements taken to guarantee a proper function of the DAS and the corresponding sensors. The first monitoring report describes the period between the 1<sup>st</sup> March 2011 and the 28<sup>th</sup> February 2012 (Grava et al., 2012). The monitoring period from the 1<sup>st</sup> March 2012 to the 28<sup>th</sup> February 2013 is documented in Gräfe and Rössli (2013).

This report covers the period between the 1<sup>st</sup> March 2013 and the 28<sup>th</sup> February 2014.

To monitor the engineered barrier system (EBS) and host rock behaviour during the HE-E Experiment, specific sensors were installed in three main zones and can therefore be divided in three different groups: (1) The engineered barrier system (EBS) and EBS/host rock interface, (2) the Opalinus clay host rock in the microtunnel sections and (3) the Opalinus Clay host rock in boreholes drilled from the Gallery 98. The monitoring of the two heater elements is not included in this report as the sensors are connected to another data acquisition system.

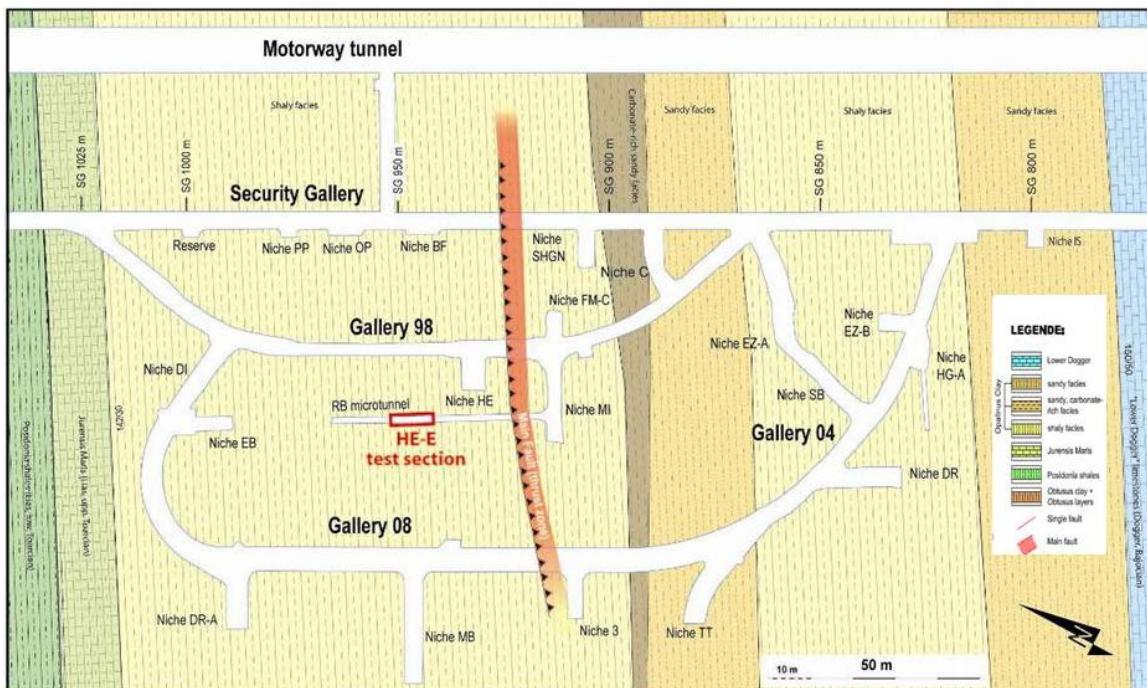

Figure 1: Location of the HE-E test section in the Mont Terri rock laboratory

DAS related work is described in Chapter 3. The field activity logbook and the data acquisition logbook are included in Appendix A. A list with all the sensors and their specifications and the schematic drawings of the sensor locations are included in Appendix B. The graphs of the measurements are shown in Appendices C, D and E.

## 2 FIELD ACTIVITIES

The construction and instrumentation works took place between January and May 2011. The experiment layout is described in detail in the as-built report (Teodori S. & Gaus I., 2012).

No field activities were performed during the monitoring period between the 1<sup>st</sup> March 2013 and the 28<sup>th</sup> February 2014.

## 3 DATA ACQUISITION SYSTEM (DAS)

The data acquisition system (DAS) worked fine for the entire monitoring period. During instrumentation, all sensors of the previous VE Experiment were connected to the DAS of the HE-E Experiment. However, several sensor signals were already erroneous during the last observation period of the VE Experiment. To check the performance of these sensors, they were also connected to the HE-E DAS. Most of these sensors proved to be defective and were disconnected after the end of the instrumentation.

Table 3 summarises the main DAS problems and the defective sensors. A detailed DAS logbook with all sensor malfunctions, failures or removals is shown in Appendix A. A list with all sensors and their status at the end of the monitoring period is given in Appendix B.

The CR7 logger which monitors the psychrometers was removed on the 22<sup>nd</sup> May 2012. Therefore no psychrometer data are available for the entire observation period.

Table 3: DAS interruptions and defective sensors

Date	Sensor name and type	Section	Events
Since 22.05.2012	All sensors	Psychrometers	SB1 and SB2
Since 23.03.2013	HC-B64	Humidity	SB1
Since 06.07.2013	HC-B10	Humidity	SB2
24.05. -19.08.2013	HC-SB2	Humidity	SB2
08.11.2012 – 04.08.2013	HC-B14	Humidity	SB2
12.06.2013 – 19.08.2013	HC-SB2	Humidity	SB2
Since 14.09.2013	HC-B66	Humidity	SB1

Date	Sensor name and type		Section	Events
17.10. – 20.11.2013	P-B40	Pressure	SA3	Noisy or erroneous measurements
05.11.2012 - 20.10.2013 11.12.2013 – 28.02.2014	HC-B71	Humidity	SB1	Error measurements
09.01.2013 – 01.01.2014	HC-B20	Humidity	SB2	Error measurements

## 4 SENSORS IN MICROTUNNEL SECTIONS

Six sections perpendiculars to the microtunnel axis are equipped with 24 Mini-Piezometer systems, humidity sensors, temperature sensors and extensometers. A great part of these sensors were already installed during the previous VE Experiment. The instrumentation is described in detail in the as-built report (Teodori & Gaus, 2012). An overview of the sections relative to the tunnel and their layouts are included in Appendix B.

### 4.1 PORE PRESSURE AND TEMPERATURE MEASUREMENTS IN SECTIONS SA1 TO SA4, SA20 AND SD20

The Mini-Piezometers in sections SA1, SA2, SA3 and SA4 were installed during the VE Experiment. The two sections SA20 and SD20 were equipped in the framework of the HE-E Experiment.

#### 4.1.1 Section SA1

The corresponding data plot is included in Appendix C1. Pressure sensor P-B81 reflected atmospheric conditions during the entire monitoring period whereas the other sensors in section SA1 showed increasing pressures. Since the 5<sup>th</sup> September 2013 sensor P-B80 increased from atmospheric pressures to about 150 kPa at the end of the observation period. Sensor P-B79 continuously increased from 125 kPa to about 250 kPa since the 23<sup>rd</sup> April. Sensor P-B78 decreased at the beginning of the observation period, followed by a pressure increase and stable pressure measurements at about 380 kPa since the 21<sup>st</sup> August.

#### 4.1.2 Section SA2

The corresponding data plot is included in Appendix C2. The pressure sensors P-B59, P-B58 and P-B57 in section SA2 reflected atmospheric conditions throughout the observation period. The pressures measured with sensors P-B60 and P-B61 steadily increased to maximum pressures of 276 and 332 kPa, respectively. The pressure measurements of sensors P-B56 and P-B62 increased until April 2013 to pressures of about 720 kPa and 780 kPa followed by a slight decrease to pressures of about 700 kPa and 760 kPa. Pressures measured by sensor P-B55 showed a slight increase to about 980 kPa until April 2013 and then decreased to about 940 kPa.

#### 4.1.3 Section SA3

The corresponding data plot is included in Appendix C3. The pressures of all sensors were increasing to pressures between about 400 kPa and 750 kPa until April 2013, followed by a slight decrease to pressures between 360 kPa and 730 kPa. On the 18<sup>th</sup> February 2014 the pressure measurements of sensor P-B40 started to decrease to about 217 kPa at the end of the observation period.

#### **4.1.4 Section SA4**

The corresponding data plot is included in Appendix C4. Except for sensor P-B7 the pressure sensors in section SA4 reflected atmospheric conditions. The pressure measured with sensor P-B7 stayed at about 760 kPa until the 7<sup>th</sup> August 2013 when it started to decrease to pressures below atmospheric conditions at the end of the observation period.

#### **4.1.5 Section SA20**

These sensors are located in section SA2 (see Appendix B). The corresponding data plot is included in Appendix C5. The pressure sensors in section SA20 reflected about atmospheric conditions.

The measured temperatures were mostly constant with a maximum temperature of about 42 °C (T-BESA25).

#### **4.1.6 Section SD20**

These sensors are located in section SD2 (see Appendix B). The corresponding data plot is included in Appendix C6. All pressure sensors in section SD20 reflected about atmospheric conditions. The pressure measured with sensor P-BESD25 showed some minor variations between about 92 and 97 kPa.

The temperatures were mostly constant with a maximum temperature of about 40 °C.

### **4.2 ROCK DISPLACEMENT SENSORS INCLUDING TEMPERATURE MEASUREMENTS**

The Solexperts displacement sensors (mini-extensometers) including temperature measurements were installed in sections SD1 and SD2 during the VE Experiment.

#### **4.2.1 Section SD1**

The corresponding data plot is included in Appendix C7. The values of rock displacement of sensors RD-B46, RD-B47 and RD-B49 were mostly stable throughout the observation period.

The temperatures were mostly constant with a maximum temperature of about 43 °C.

#### **4.2.2 Section SD2**

The corresponding data plot is included in Appendix C8. The values of rock displacement of sensors RD-B25, RD-B26 and RD-B28 were mostly stable throughout the observation period.

The temperatures were constant with a maximum temperature of about 93 °C (T-B25).

### **4.3 ROCK WATER CONTENT MEASUREMENTS**

The capacitive relative humidity and temperature sensors and the psychrometers were installed in boreholes in the profiles SB1 and SB2 during the VE Experiment. The relative humidity sensor mostly gave measurements of 100 % RH or negative values, except for a few sensors mentioned below. The measurements of 100 % RH might therefore be an artefact, but are displayed in the graphs for completeness.

#### **4.3.1 Capacitive Sensors including Temperature in Section SB1**

The corresponding data plot is included in Appendix C9. The measured relative humidity values of sensor HC-B73 was constant at 100 %. The other sensors HC-B64, HC-B66 and HC-B71 partially measured humidity values of 100 % (see Appendix A) but gave negative measurements at the end of the observation period and seem to be defective.

The temperatures were mostly constant with a maximum temperature of about 43 °C (T-SB1).

#### **4.3.2 Capacitive Sensors including Temperature in Section SB2**

The corresponding data plot is included in Appendix C10. The measured relative humidity values for sensor HC-B92, HC-B93, HC-B94, HC-B95, HC-B14, were at 100 % throughout the observation period. Sensor HC-B12 measured humidities of over 98 % until May 2013 and then 100 % until the end of the observation period. The measurements of sensor HC-B20 were erroneous from the beginning of the observation period until the 31<sup>st</sup> December 2013. After that date the sensor measured relative humidities of 100 %.

The temperatures were mostly constant with a maximum temperature of about 44 °C (T-SB2).

#### **4.3.3 Psychrometers in Section SB1 and SB2**

During the entire observation period, the CR7 logger was removed and no data were recorded.

### **4.4 PORE PRESSURE MEASUREMENTS IN THE BOREHOLES FROM THE GALLERY GA98**

4 multi-packer systems were installed from Gallery 98 for far-field pore pressure measurements. Borehole BVE-1 and BVE-91 were drilled and equipped with a triple and a quadruple packer system during the VE Experiment. Borehole BHE-E1 was installed on 30<sup>th</sup> March 2011 and borehole BHE-E2 on 4<sup>th</sup> May 2011, both equipped with a quadruple packer system. An overview of the borehole instrumentation is shown in Appendix B. Data plots are included in Appendices D1 to D4.

Generally, most pressure data of interval and packer pressures show only small changes or variations in the measurements throughout the observation period.

In borehole BHE-E1, the pressure sensors for the packers and intervals worked fine during the entire observation period. The interval pressure sensor P-BE1-I1 showed a continuous pressure increase. The pressure measurements of interval pressure sensors P-BE1-I2, P-BE1-i3 and P-BE1-I4 showed only small variations throughout the observation period. The packer pressure measurements remained constant except for packer pressure sensor P-BE1-P3 which continuously decreased from the 7<sup>th</sup> July 2013 to about 1000 kPa.

The packer and interval pressure sensors of borehole BHE-E2 worked fine. Sensor P-BE2-I4 gave noisy measurements throughout the observation period. On the 29<sup>th</sup> January 2014 all interval pressure sensor measurements started to decrease.

The interval pressures of the packer systems installed during the VE experiment (BVE-1 and BVE-91) worked fine during the entire observation period. The pressure measurements generally were slightly decreasing.

## 5 SENSORS IN THE EBS AND THE EBS/HOST ROCK INTERFACE

The EBS and the host rock/EBS interface were instrumented with temperature and relative humidity sensors. An overview of sensor locations is shown in Appendix B and data plots are in Appendices E1 to E6.

All sensors worked fine for the entire observation period. The sensors T-G3-R, HC-G3-R, T-N1-R and HC-N1-R are installed inside the railroad under the plug. Therefore, the measurements represent the climatic conditions of the cable channel.

In general, the temperatures stayed constant throughout the observation period.

The humidity measurements at middle and centre positions and within the bentonite blocks remained mostly constant with maximum relative humidity values of about 30 %. The humidity at the EBS-host rock interface was almost or at 100 %. Sensors HC-N3-9H and HC-N1-3H measured about 90 % humidity for the entire observation period. On the 28<sup>th</sup> April 2014 the measurements of sensor HC-G1-3H start to decrease from initially 100 % to about 90 % humidity with an increasing trend at the end of the observation period. All relative humidity sensors measuring 100 % humidity are noted in Appendix B.

## 6 SUMMARY

The sensor measurements in the microtunnel sections worked without problems throughout the observation period. Three sensors, sensors HC-B64 and HC-B66 in section SB1 and sensor HC-B10 in section SB2 were found to be defective. During the monitoring period, the heater temperatures sensors of the three heaters measured constant temperatures which were in the range of 175°C to 190 °C, depending on the heater.
